Question 1

Correct

Marked out of  
3.00

Flag question

### Objective

This is a simple challenge to help you practice printing to stdout.

We're starting out by printing the most famous computing phrase of all time! In the editor below, use either `printf` or `cout` to print the string ***Hello, World!*** to stdout.

### Input Format

You do not need to read any input in this challenge.

### Output Format

Print ***Hello, World!*** to stdout.

### Sample Output

Hello, World!

Answer: (penalty regime: 0 %)

Hello, World!

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(void){
3     printf("Hello, World!");
4     return 0;
5 }
```

	Expected	Got	
✓	Hello, World!	Hello, World!	✓

Passed all tests! ✓

Question **2**

Correct

Marked out of  
5.00

🚩 Flag question

### Objective

This challenge will help you to learn how to take a character, a string and a sentence as input in C.

To take a single character **ch** as input, you can use `scanf("%c", &ch);` and `printf("%c", ch)` writes a character specified by the argument **char** to **stdout**:

```
char ch;  
scanf("%c", &ch);  
printf("%c", ch);
```

This piece of code prints the character **ch**.

### Task

You have to print the character, **ch**.

### Input Format

Take a character, **ch** as input.

### Output Format

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(){
3     char ch;
4     scanf("%c",&ch);
5     printf("%c",ch);
6     return 0;
7 }
```

	Input	Expected	Got	
✓	c	c	c	✓

Passed all tests! ✓

Correct

Marked out of  
7.00

🚩 Flag question

The fundamental data types in C are int, float and char. Today, we're discussing int and float data types.

The `printf()` function prints the given statement to the console. The syntax is `printf("format string", argument_list);`. In the function, if we are using an integer, character, string or float as argument, then in the format string we have to write `%d` (integer), `%c` (character), `%s` (string), `%f` (float) respectively.

The `scanf()` function reads the input data from the console. The syntax is `scanf("format string", argument_list);`. For ex  
The `scanf("%d", &number)` statement reads integer number from the console and stores the given value in variable **number**.

To input two integers separated by a space on a single line, the command is `scanf("%d %d", &n, &m)`, where **n** and **m** are the two integers.

#### Task

Your task is to take two numbers of **int data type**, two numbers of **float data type** as input and output their sum:

1. Declare **4** variables: two of type **int** and two of type **float**.
2. Read **2** lines of input from **stdin** (according to the sequence given in the 'Input Format' section below) and initialize your **4** variables.
3. Use the **+** and **-** operator to perform the following operations:
  - o Print the sum and difference of two **int** variable on a new line.
  - o Print the sum and difference of two **float** variable rounded to one decimal place on a new line.

#### Input Format

```

1 #include<stdio.h>
2 int main(){
3     int a,b;
4     float c,d;
5     scanf("%d %d",&a,&b);
6     scanf("%f %f",&c,&d);
7     printf("%d %d\n",a+b, a-b);
8     printf("%.1f %.1f",c+d, c-d);
9
10    return 0;
11
12 }

```

	Input	Expected	Got	
✓	10 4 4.0 2.0	14 6 6.0 2.0	14 6 6.0 2.0	✓
✓	20 8 8.0 4.0	28 12 12.0 4.0	28 12 12.0 4.0	✓

Passed all tests! ✓
